

The system employs a multi-layered, adversarial framework designed to enforce factual integrity in long-form legal documents. The process follows these strategic stages:

- **Deterministic Ingestion:** The workflow begins by processing a 20-page PDF record through **Chunking and Entity Mapping**. This stage identifies key actors and roles to ensure consistent subject tracking throughout the analysis.
- **The Auditor Cycle (Fact-Checking):** This core loop utilizes two specialized agents with conflicting incentives. The **WRITER Agent** generates **Atomic Information Units (AIUs)**, which are immediately intercepted by the **AUDITOR Agent**. The Auditor performs an **Evidence Query** against a **Precision RAG / Vector Database** to validate every claim.
- **Friction and Resolution:** If the Auditor identifies a **Contradiction Found**, it triggers a **Request for Clarification** toward **Human Interaction**. This ensures that factual tensions are resolved by the judge's decision rather than AI speculation, feeding the human's choice back into the Writer Agent to refine the draft.
- **Deterministic Security:** Simultaneously, all **Proposed Legal Citations** are routed through a **Citations Firewall**. This component performs real-time validation against an **External Legal Database** to prevent the fabrication of case law or statutes.
- **Final Verification:** The process culminates in a **Draft with Annotations and Links**, providing full transparency of sources. The **Judge or Clerk** performs the **Final Review**, where they can approve or edit the content, resulting in a legally sound **Signed Report or Order**.
